

KBA: IQ3 V13.1 RELEASE NOTES

Vericord IQ3 • Version 13.1 • IQ3 & MMS

1. RELEASE NOTES

#	Feature	Specification	Rationale
1	Conditional Logic Alerting	Conditional logic alerts must include the marker selection, marker comment, and inspector full name in the alert message, plus Asset ID and Event title. Previously, only the marker title of the alerted marker was sent.	Recipients understand the context of the alert without opening the inspection.
2	Asset ID & Repository Column Toggles	Asset ID and Repository can be displayed as independent, toggleable columns on the MMS search page, available per tenant configuration.	Improves search page usability and supports workflows that rely on either field.
3	Hover-Over Text Display on Search Page	When a column contains more text than is visible, hovering shows the full content in a tooltip or flyout.	Saves time by eliminating the need to resize columns.
4	RevScribe Removal from Search Page	The RevScribe button is removed from the MMS search page.	It confused users who are not using RevScribe and served no purpose during search.
5	Auto Report Title Page Photo	A setting in Auto Report Output uploads a "Title Page Photo." The image appears at the top of the report without interfering with the logo placement.	Supports standardized report formatting and branding.
6	MMS Default Search Time Range	Tenants can set a default search range (for example, 72 hours) on the MMS Search page. The setting applies tenant-wide.	Reduces repeated input for common search intervals.
7	Mandatory Sign-Off Method Configuration	When sign-off is required, tenants can select the allowed methods: Local Sign, Remote Sign, No Sign, or Both. If only one is selected, it opens automatically after the inspection and triggers upload if enabled.	Increases control over compliance workflows.
8	Inspection Photo Library Access via Search Page	A photo icon column on the search page opens a fast-loading, grid-style photo library with one-click download.	Faster access to inspection photos.
9	Report-Focused Search Page Mode	Double-clicking a row opens the PDF report immediately, and a new "Export Report" column icon is added. Active only when auto-report settings are configured.	Streamlines workflows for report-centric users.
10	Export Directly From Search Page	Users can export the inspection report from the search page.	—
11	Pass/Fail Status as Colored Column Blocks	When a pass/fail status is present, it displays as a colored block (green for Pass, red for Fail) in a dedicated column.	Quick scanning of inspection outcomes.

#	Feature	Specification	Rationale
12	Pass/Fail Status Upload Alerts	Upload alerts include Pass/Fail status, comments, Asset ID, Repository, and inspector full name.	Alerts are actionable without further digging.
13	Hold Event Renamed "Save as Draft"	The app button label changes from "Hold" to "Save as Draft."	Reduces confusion about the button's function.
14	Custom Labeling Framework	System labels such as "Repositories" and "Asset ID" can be renamed per tenant.	Aligns terminology with each client organization.
15	Disable MMS Slider for IQ3 View Tenancies	The playback slider is removed from the search page unless a media event is open.	Reduces UI clutter.
16	Entered Flags Area in Report Output	A table near the top of the report lists all flagged markers with custom titles, selections, and comments.	Surfaces key issues early in the report.
17	Auto-Report Filename Format Update	Auto-generated reports use the file name format AssetID_Date.pdf.	Improves file management.
18	Report Section Separators	Visual separators, such as bars or lines, divide report sections. Section titles may be embedded.	Increases report readability.
19	App Home Screen Information Update	The app home screen shows Inspection Title, Template, Asset ID, and Repository. The "Run Time" display is removed.	Shows relevant information without clutter.
20	Post-Inspection Marker Display Update	Post-inspection markers are organized by section, with selection and notes shown clearly.	Improves event review clarity.
21	Inspector Signature and Job Title Insertion	If the inspector's profile has a saved signature and job title, they populate local sign-offs automatically.	Saves time and ensures consistency.
22	Hide Non-Applicable Inspection Formats	If a template supports only one inspection format, the other options are hidden and a "Begin Inspection" button with the correct icon is shown.	Reduces clutter and user error.
23	Remove Recording Time Left Message	The "Recording Time Left" message is removed from the pre-inspection screen.	Prevents confusion and support tickets.
24	Repository Dropdown Ordering	Tenants can set the sort order for Repository dropdowns.	Improves navigation for large lists.
25	PDF Photo Spacing Normalization	Single photos on PDF reports align to the left margin like multi-photo layouts.	Improves consistency across reports.
26	Multiple Copy Section Functionality	Any IQ3 template section can be made a "multiple copy section." Enable it for specific sections from the sections page of the MMS template creator.	—
